INBOUND COMPLIANCE

Streamline Warehouse Carrier Accountability

The Problem:

Current methods for tracking inbound compliance issues are inconsistent, delayed, and don’t provide line of sight to vendors. This creates operational inefficiencies when warehouses experience vendor issues, such as damages, poor pallet quality, missing documentation, or late arrivals.

Our Solution:

Inbound Compliance is a web-based platform that provides warehouse teams with an efficient way to communicate and track receiving issues. By establishing a single source of truth with total network visibility, the platform enforces warehouse receiving standards, streamlines dock efficiency, and gives vendors clear line of sight to review violations.

How It Works:

Warehouse teams log operational violations directly against open POs.

Violations are categorized, documented, and time-stamped with photos.

Vendors review pending violations inside a secure, time-bound portal.

Leaders use data to monitor performance and drive accountability at scale.

Benefits of Inbound Compliance:

- Creates a single source of truth for warehouses and vendors derived from fact-based information
- Enforces warehouse receiving standards through shared performance accountability
- Provides vendors with line of sight and the ability to dispute violations
- Enhances operational efficiencies and provides total network visibility across all facilities
